# SVM with Explicit Feature Map

- Let  $\psi: \mathfrak{X} \to \mathsf{R}^d$  be a feature map.
- The SVM objective (with explicit feature map):

$$\min_{w \in \mathbb{R}^d} \frac{1}{2} ||w||^2 + \frac{c}{n} \sum_{i=1}^n \max(0, 1 - y_i w^T \psi(x_i)).$$

- Computation is costly if d is large (e.g. with high-degree monomials)
- Last time we mentioned an equivalent optimization problem from Lagrangian duality.

He He (CDS, NYU) DS-GA 1003 March 2, 2021 2/23

### SVM Dual Problem

• By Lagrangian duality, it is equivalent to solve the following dual problem:

maximize 
$$\sum_{i=1}^{n} \alpha_{i} - \frac{1}{2} \sum_{i,j=1}^{n} \alpha_{i} \alpha_{j} y_{i} y_{j} \psi(x_{j})^{T} \psi(x_{i})$$
s.t. 
$$\sum_{i=1}^{n} \alpha_{i} y_{i} = 0 \quad \text{and} \quad \alpha_{i} \in \left[0, \frac{c}{n}\right] \quad \forall i.$$

• If  $\alpha^*$  is an optimal value, then

$$w^* = \sum_{i=1}^n \alpha_i^* y_i \psi(x_i)$$
 and  $\hat{f}(x) = \sum_{i=1}^n \alpha_i^* y_i \psi(x_i)^T \psi(x)$ .

• Key observation:  $\psi(x)$  only shows up in inner products with another  $\psi(x')$  for both training and inference.

# Compute the Inner Products

Consider 2D data. Let's introduce degree-2 monomials using  $\psi:\mathsf{R}^2\to\mathsf{R}^3.$ 

$$(x_1, x_2) \mapsto (x_1^2, \sqrt{2}x_1x_2, x_2^2).$$

The inner product is

$$\psi(x)^{T}\psi(x') = x_{1}^{2}x_{1}'^{2} + (\sqrt{2}x_{1}x_{2})(\sqrt{2}x_{1}'x_{2}') + x_{2}^{2}x_{2}'^{2}$$

$$= (x_{1}x_{1}')^{2} + 2(x_{1}x_{1}')(x_{2}x_{2}') + (x_{2}x_{2}')^{2}$$

$$= (x_{1}x_{1}' + x_{2}x_{2}')^{2}$$

$$= (x^{T}x')^{2}$$

We can calculate the inner product  $\psi(x)^T \psi(x')$  without accessing the features  $\psi(x)$ !

He He (CDS, NYU) DS-GA 1003 March 2, 2021

4 / 23

## Compute the Inner Products

Now, consider monomials up to degree-2:

$$(x_1, x_2) \mapsto (1, \sqrt{2}x_1, \sqrt{2}x_2, x_1^2, \sqrt{2}x_1x_2, x_2^2).$$

The inner product can be computed by

$$\psi(x)^T \psi(x') = (1 + x^T x')^2$$
 (check).

More generally, for features maps producing monomials up to degree-p, we have

$$\psi(x)^T \psi(x') = (1 + x^T x')^p$$
.

(Note that the coefficients of each monomial in  $\psi$  may not be 1)

Kernel trick: we do not need explicit features to calculate inner products.

- Using explicit features:  $O(d^p)$
- Using implicit computation: O(d)

He He (CDS, NYU) DS-GA 1003 March 2, 2021 5 / 23

## Kernel Function

March 2, 2021

### The Kernel Function

- $\bullet \ \, \textbf{Input space} \colon \, \mathfrak{X}$
- Feature space:  $\mathcal{H}$  (a Hilbert space, e.g.  $\mathbb{R}^d$ )
- Feature map:  $\psi: \mathfrak{X} \to \mathcal{H}$
- The kernel function corresponding to  $\psi$  is

$$k(x,x') = \langle \psi(x), \psi(x') \rangle$$
,

where  $\langle \cdot, \cdot \rangle$  is the inner product associated with  $\mathcal{H}$ .

Why introduce this new notation k(x,x')?

• We can often evaluate k(x,x') without explicitly computing  $\psi(x)$  and  $\psi(x')$ .

When can we use the kernel trick?

## Some Methods Can Be "Kernelized"

#### Definition

A method is **kernelized** if every feature vector  $\psi(x)$  only appears inside an inner product with another feature vector  $\psi(x')$ . This applies to both the optimization problem and the prediction function.

The SVM Dual is a kernelization of the original SVM formulation.

Optimization:

maximize 
$$\sum_{i=1}^{n} \alpha_{i} - \frac{1}{2} \sum_{i,j=1}^{n} \alpha_{i} \alpha_{j} y_{i} y_{j} \psi(x_{j})^{T} \psi(x_{i})$$

s.t. 
$$\sum_{i=1}^{n} \alpha_{i} y_{i} = 0 \quad \text{and} \quad \alpha_{i} \in \left[0, \frac{c}{n}\right] \quad \forall i.$$

Prediction:

$$\hat{f}(x) = \sum_{i=1}^{n} \alpha_i^* y_i \psi(x_i)^T \psi(x).$$
DS-GA 1003

8 / 23

#### Definition

The **kernel matrix** for a kernel k on  $x_1, \ldots, x_n \in \mathcal{X}$  is

$$K = (k(x_i, x_j))_{i,j} = \begin{pmatrix} k(x_1, x_1) & \cdots & k(x_1, x_n) \\ \vdots & \ddots & \cdots \\ k(x_n, x_1) & \cdots & k(x_n, x_n) \end{pmatrix} \in \mathbb{R}^{n \times n}.$$

• In ML this is also called a **Gram matrix**, but traditionally (in linear algebra), Gram matrices are defined without reference to a kernel or feature map.

### The Kernel Matrix

- The kernel matrix summarizes all the information we need about the training inputs  $x_1, \ldots, x_n$  to solve a kernelized optimization problem.
- In the kernelized SVM, we can replace  $\psi(x_i)^T \psi(x_j)$  with  $K_{ij}$ :

$$\begin{aligned} \text{maximize}_{\alpha} & & \sum_{i=1}^{n} \alpha_{i} - \frac{1}{2} \sum_{i,j=1}^{n} \alpha_{i} \alpha_{j} y_{i} y_{j} \textbf{\textit{K}}_{ij} \\ \text{s.t.} & & \sum_{i=1}^{n} \alpha_{i} y_{i} = 0 \quad \text{and} \quad \alpha_{i} \in \left[0, \frac{c}{n}\right] \ i = 1, \dots, n. \end{aligned}$$

He He (CDS, NYU) DS-GA 1003 March 2, 2021 10 / 23

Given a kernelized ML algorithm (i.e. all  $\psi(x)$ 's show up as  $\langle \psi(x), \psi(x') \rangle$ ),

- Can swap out the inner product for a new kernel function.
- New kernel may correspond to a very high-dimensional feature space.
- Once the kernel matrix is computed, the computational cost depends on number of data points n, rather than the dimension of feature space d.
- Useful when d >> n.
- Computing the kernel matrix may still depend on d and the essence of the **trick** is getting around this O(d) dependence.

He He (CDS, NYU) DS-GA 1003 March 2, 2021 11 / 23

Example Kernels

## Kernels as Similarity Scores

- Often useful to think of the k(x,x') as a similarity score for x and x'.
- We can design similarity functions without thinking about the explicit feature map, e.g. "string kernels", "graph kerners".
- How do we know that our kernel functions actually correspond to inner products in some feature space?

### How to Get Kernels?

- Explicitly construct  $\psi(x): \mathcal{X} \to \mathsf{R}^d$  (e.g. monomials) and define  $k(x, x') = \psi(x)^T \psi(x')$ .
- Directly define the kernel function k(x,x') ("similarity score"), and verify it corresponds to  $\langle \psi(x), \psi(x') \rangle$  for some  $\psi$ .

There are many theorems to help us with the second approach.

Linear Algebra Review: Positive Semidefinite Matrices

#### **Definition**

A real, symmetric matrix  $M \in \mathbb{R}^{n \times n}$  is **positive semidefinite (psd)** if for any  $x \in \mathbb{R}^n$ ,

$$x^T M x \geqslant 0$$
.

#### Theorem

The following conditions are each necessary and sufficient for a symmetric matrix M to be positive semidefinite:

- M can be factorized as  $M = R^T R$ , for some matrix R.
- All eigenvalues of M are greater than or equal to 0.

## Positive Definite Kernel

#### **Definition**

A symmetric function  $k: \mathcal{X} \times \mathcal{X} \to \mathsf{R}$  is a **positive definite (pd)** kernel on  $\mathcal{X}$  if for any finite set  $\{x_1, \ldots, x_n\} \in \mathcal{X}$   $(n \in \mathbb{N})$ , the kernel matrix on this set

$$K = (k(x_i, x_j))_{i,j} = \begin{pmatrix} k(x_1, x_1) & \cdots & k(x_1, x_n) \\ \vdots & \ddots & \cdots \\ k(x_n, x_1) & \cdots & k(x_n, x_n) \end{pmatrix}$$

is a positive semidefinite matrix.

- Symmetric: k(x,x') = k(x',x)
- The kernel matrix needs to be positive semidefinite for any finite set of points.
- Equivalent definition:  $\sum_{i=1}^{n} \sum_{j=1}^{n} \alpha_i \alpha_j k(x_i, x_j) \ge 0$  given  $\alpha_i \in \mathbb{R} \ \forall i$ .

He He (CDS, NYU) DS-GA 1003 March 2, 2021

## Mercer's Theorem

#### Theorem

A symmetric function k(x,x') can be expressed as an inner product

$$k(x,x') = \langle \psi(x), \psi(x') \rangle$$

for some  $\psi$  if and only if k(x,x') is **positive definite**.

- Proving a kernel function is positive definite is typically not easy.
- But we can construct new kernels from valid kernels.

# Generating New Kernels from Old

• Suppose k,  $k_1$ ,  $k_2 : \mathcal{X} \times \mathcal{X} \to \mathsf{R}$  are pd kernels. Then so are the following:

$$\begin{array}{lll} k_{\mathsf{new}}(x,x') &=& \alpha k(x,x') \quad \text{for } \alpha \geqslant 0 \quad \text{(non-negative scaling)} \\ k_{\mathsf{new}}(x,x') &=& k_1(x,x') + k_2(x,x') \quad \text{(sum)} \\ k_{\mathsf{new}}(x,x') &=& k_1(x,x')k_2(x,x') \quad \text{(product)} \\ k_{\mathsf{new}}(x,x') &=& k(\psi(x),\psi(x')) \quad \text{for any function } \psi(\cdot) \quad \text{(recursion)} \\ k_{\mathsf{new}}(x,x') &=& f(x)f(x') \quad \text{for any function } f(\cdot) \quad \text{($f$ as 1D feature map)} \end{array}$$

• Lots more theorems to help you construct new kernels from old.

Based on Mark Schmidt's slides:https://www.cs.ubc.ca/~schmidtm/Courses/540-W19/L12.5.pdf

## Linear Kernel

- Input space:  $\mathfrak{X} = \mathbb{R}^d$
- Feature space:  $\mathcal{H} = \mathbb{R}^d$ , with standard inner product
- Feature map

$$\psi(x) = x$$

• Kernel:

$$k(x,x') = x^T x'$$

# Quadratic Kernel in R<sup>d</sup>

- Input space  $\mathfrak{X} = \mathsf{R}^d$
- Feature space:  $\mathcal{H} = \mathbb{R}^D$ , where  $D = d + {d \choose 2} \approx d^2/2$ .
- Feature map:

$$\psi(x) = (x_1, \dots, x_d, x_1^2, \dots, x_d^2, \sqrt{2}x_1x_2, \dots, \sqrt{2}x_ix_j, \dots \sqrt{2}x_{d-1}x_d)^T$$

• Then for  $\forall x, x' \in \mathbb{R}^d$ 

$$k(x,x') = \langle \psi(x), \psi(x') \rangle$$
  
=  $\langle x, x' \rangle + \langle x, x' \rangle^2$ 

- Computation for inner product with explicit mapping:  $O(d^2)$
- Computation for implicit kernel calculation: O(d).

# Polynomial Kernel in R<sup>d</sup>

- Input space  $\mathfrak{X} = \mathbb{R}^d$
- Kernel function:

$$k(x,x') = (1 + \langle x,x' \rangle)^M$$

- $\bullet$  Corresponds to a feature map with all monomials up to degree M.
- For any M, computing the kernel has same computational cost
- ullet Cost of explicit inner product computation grows rapidly in M.

# Radial Basis Function (RBF) / Gaussian Kernel

Input space  $\mathfrak{X} = \mathbb{R}^d$ 

$$k(x,x') = \exp\left(-\frac{\|x-x'\|^2}{2\sigma^2}\right),\,$$

where  $\sigma^2$  is known as the bandwidth parameter.

- Probably the most common nonlinear kernel.
- Does it act like a similarity score?
- Why "radial"?
- Have we departed from our "inner product of feature vector" recipe?
  - Yes and no: corresponds to an infinite dimensional feature vector

# Remaining Questions

#### Our current recipe:

- Recognize kernelized problem:  $\psi(x)$  only occur in inner products  $\psi(x)^T \psi(x')$
- Pick a kernel function ("similarity score")
- Compute the kernel matrix (n by n where n is the dataset size)
- Optimize the model and make predictions by accessing the kernel matrix

Next: When can we apply kernelization?
